## APPLICATION NOTES

### 1. Input filtering

To reduce the reflected ripple current and minimize EMI, especially when the converter input is more than 2" away from the DC source, it is recommended to connect a low ESR electrolytic capacitor between Vin and Gnd. The values suggested are as shown in Table 1. If additional filtering is required, the capacitance may be increased, or expanded to an LC network as shown in Figure 1.

**Table 1**

| Input Voltage | External Input Capacitance |
|---------------|----------------------------|
| 5 V           | 4.7 $\mu$ F                |
| 12 V          | 2.2 $\mu$ F                |
| 15 V          | 2.2 $\mu$ F                |
| 24 V          | 1.0 $\mu$ F                |

**Figure 1**

### 2. Output filtering

An output capacitor is needed to meet output ripple requirements as shown in Table 2. Output capacitance may be increased for additional filtering, but should not exceed 10 $\mu$ F or expanded to an LC network as in Figure 1.

**Table 2**

| Output Voltage | External Output Capacitance |
|----------------|-----------------------------|
| 3.3, 5 V       | 4.7 $\mu$ F                 |
| 9 V            | 2.2 $\mu$ F                 |
| 12 V           | 1.0 $\mu$ F                 |
| 15 V           | 0.47 $\mu$ F                |
| 24 V           | 0.33 $\mu$ F                |

**Figure 2**

### 3. Minimum loading

The converter needs a minimum of 10% loading to maintain output regulation. Operation under no-load conditions will not cause immediate damages but may reduce reliability, and cause performance not to meet specifications.

### 4. Regulation

With a semi-regulated design, the converter's output voltage varies with load current and will change proportionally to the input voltage. If regulated output is needed, an external regulator can be used as shown in Figure 2.

### 5. Protection

The converter has minimal protection against input over-voltage or output over-load, and may be permanently damaged if exposed to these conditions. An input clamping device can be used for input voltage limiting. An input fuse or an output fuse can also be used to protect against over-loading.

### 6. External Regulator

An external 3-terminal regulator can be connected to the output of the converter to achieve full regulation. Make sure the converter's output voltage provides sufficient head room for the regulator. An additional benefit is that the built-in protection features in the regulator, such as OCP, OTP, etc, will protect the converter also. In a complimentary supply, a negative output regulator must be used to achieve the negative regulated output.
