

# PEC550-12-074xA

## AC-DC CRPS Front-End Power Supply

PEC550-12-074xA is a 550 Watt, CRPS AC to DC power supply module with a +12 V main DC output and a +12 V standby output. The power supply operates as a single supply, or N+1 parallel configuration.

PEC550-12-074xA utilizes full digital control architecture for greater efficiency, control and functionality.

This power supply meets international safety standards and displays the CE-Mark for the European Low Voltage Directive (LVD).

### Key Features & Benefits

- 80 PLUS Platinum Efficiency
- Input Voltage Range 90 – 264 VAC / 180 – 300 VDC
- Output Voltage 12 VDC
- +12 VSB (2.1 A) Standby Output
- Output Power up to 550 W
- Intel Standard CRPS Form Factor
- Dimensions: 185 x 73.5 x 40 mm (7.28 x 2.89 x 1.57 in)
- High Power Density
- UL/CSA 62368-1, EN/IEC 62368-1 Safety Approved
- Supports N+1 Redundancy, Cold Redundancy, Internal ORing
- Black Box Recorder, Bootloader
- Clockwise and Counter-Clockwise Fan Rotation
- Supports Power Management Bus Communication Protocol

### Applications

- Networking Switches
- Servers & Routers
- Telecommunications

| AC Line Isolation      | Primary to secondary, reinforced insulation               | 3000 |         |     | VAC              |
|                        |                                                           | 4242 |         |     | VDC              |

\* Note: The Brown IN/OUT Hysteresis min is 5 VAC.

1. Maximum input current at low input voltage range is measured at 100-127 VAC, at max load. (7.5 Arms)
2. Maximum input current at high input voltage range is measured at 200-240 VAC, at max load. (3.6 Arms)
3. 3.6 Arms maximum while input voltage is 240 VDC at max load;
4. AC Brown-in/out loading is 80% load (low line & high line)

### 2.1 AC INPUT CONNECTOR

The AC input connector is an IEC 320 C-14 power inlet. This inlet is rated for 10 A / 250 VAC.

### 3. OUTPUT

|-------------|----------------------------------------------------------------------------|-----|-----|-------|
| Tvout rise  | Output voltage rise time from each main output.                            | 5   | 70  | ms    |
| T12vsb rise | Output voltage rise time for the +12VSB output.                            | 1   | 50  | ms    |
| Tvout_on    | All main outputs must be within regulation of each other within this time. |     | 50  | ms    |
| Tvout off   | All main outputs must leave regulation within this time.                   |     | 400 | ms    |

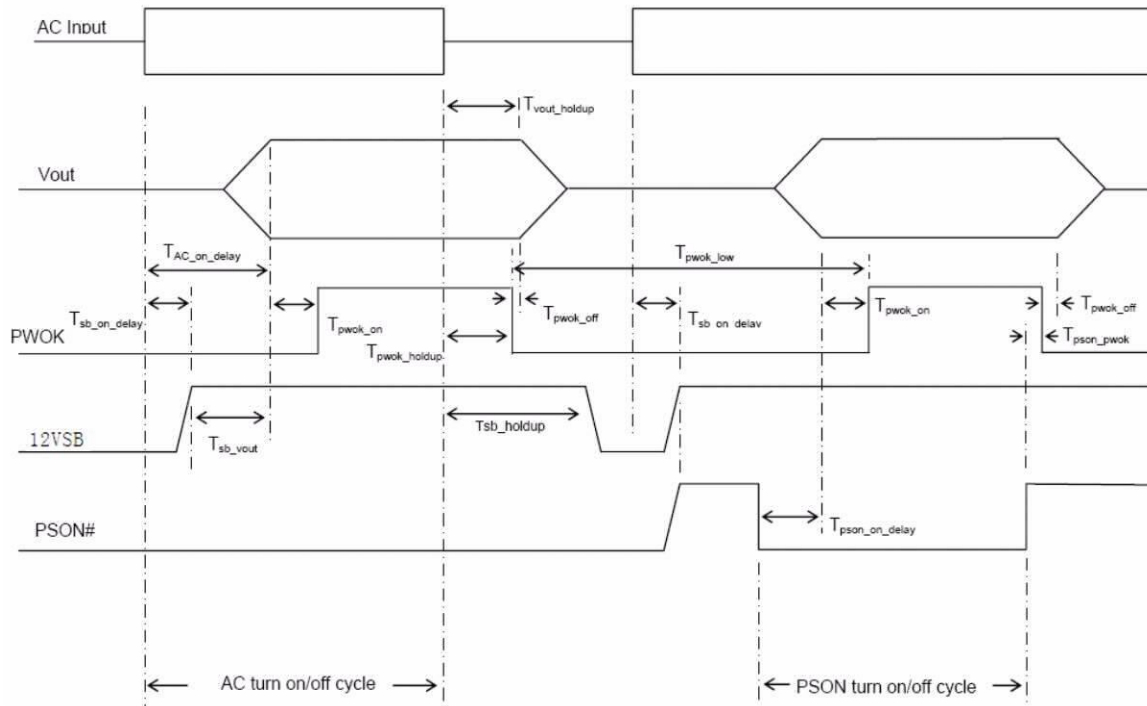

Figure 2. Signal Timing Sequence 2

**Timing Values for Signal Timing Sequence 2:**

| ITEM                       | DESCRIPTION                                                                                       | MIN | MAX  | UNITS |
|----------------------------|---------------------------------------------------------------------------------------------------|-----|------|-------|
| T <sub>sb_on delay</sub>   | Delay from AC being applied to 12VSB being within regulation.                                     |     | 1500 | ms    |
| T <sub>ac_on_delay</sub>   | Delay from AC being applied to all output voltages being within regulation.                       |     | 2500 | ms    |
| T <sub>vout holdup</sub>   | Time 12V output voltage dropping to regulation after loss of AC at 100% load condition.           | 11  |      | ms    |
| T <sub>pwok holdup</sub>   | Delay from loss of AC to desertion of PWOK at 100% load condition.                                | 10  |      | ms    |
| T <sub>pson_on_delay</sub> | Delay from PSON# active to output voltages within regulation limits.                              | 5   | 400  | ms    |
| T <sub>pson pwok</sub>     | Delay from PSON# deactivate to PWOK being deserted.                                               |     | 5    | ms    |
| T <sub>pwok_on</sub>       | Delay from output voltages within regulation limits to PWOK asserted at turn on.                  | 100 | 500  | ms    |
| T <sub>pwok off</sub>      | Delay from PWOK de-asserted to +12V dropping out of regulation limits.                            | 1   |      | ms    |
| T <sub>pwok_low</sub>      | Duration of PWOK being in the deserted state during an off/on cycle using AC or the PSON# signal. | 100 |      | ms    |
| T <sub>sb_vout</sub>       | Delay from 12 VSB being in regulation to O/Ps being in regulation at AC turn on.                  | 50  | 2000 | ms    |
| T <sub>12VSB holdup</sub>  | Time the +12VSB output voltage stays within regulation after loss of AC.                          | 70  |      | ms    |

## 4. PROTECTION

Protection circuits inside the power supply cause only the power supply’s main outputs to shutdown. If the power supply latches off due to a protection circuit tripping, an AC cycle OFF for 15 sec and a PSON# cycle HIGH for 1 sec shall be able to reset the power supply.

| PARAMETER                          | DESCRIPTION / CONDITION                 | MIN                    | NOM | MAX                     | UNIT |

| Short Circuit Protection (SCP)     | Shut down and latch off                 |                        |     |                         |      |

### 4.1 OVERVOLTAGE PROTECTION (OVP)

The power supply over voltage protection will be locally sensed. The power supply will shutdown and latch off after an over voltage condition occurs. This latch will be cleared by toggling the PSON# signal or by an AC power interruption. The values are measured at the output of the power supply’s connectors. The voltage should never exceed the maximum levels when measured at the power connectors of the power supply connector during any single point of fail. The voltage should never trip any lower than the minimum levels when measured at the power connector. 12VSB will be auto-recovered after removing OVP limit.

### 4.2 OVER TEMPERATURE PROTECTION (OTP)

The power supply will be protected against over temperature conditions caused by loss of fan cooling or excessive ambient temperature. In an OTP condition the PSU will shutdown. When the power supply temperature drops to within specified limits, the power supply will restore power automatically, while the 12 VSB remains always on. The OTP circuit must have built in margin such that the power supply will not oscillate on and off due to temperature recovering condition. The OTP trip level shall have a minimum of 5°C of ambient temperature margin.

### 4.3 CURRENT LIMITATION (OCP)

The power supply has a current limit to prevent the outputs from exceeding the values shown in table above. If the current limits are exceeded the power supply shuts down and latches off. The latch will be cleared by toggling the PSON# signal or by an AC power interruption. The power supply will not be damaged from repeated power cycling in this condition. 12 VSB will be auto-recovered after removing OCP limit.

### 4.4 SHORT CIRCUIT PROTECTION (SCP)

The power supply shuts down and latches off for shorting the main outputs. 12 VSB must be capable of being shorted indefinitely. The latch will be cleared by toggling the PSON# signal or by an AC power interruption. The power supply should not be damaged from repeated power cycling in this condition. 12 VSB will be auto-recovered after removing SCP limit.

### 4.5 OVER POWER PROTECTION (OPP)

The power supply supports over power protection (OPP) level low enough to protect the power supply running in this mode for repeated 1 msec durations at a 1% duty cycle. The power supply should be stable operating at any load point from rated power up to the OPP point.

CRPS-185 Load Requirement for OPP Threshold = (Imax + 49 A) +/-50 W  
SMBAlert shall always assert ahead of the OPP threshold being exceeded

|                     |                            |                      |
|---------------------|----------------------------|----------------------|
| <b>Asia-Pacific</b> | <b>Europe, Middle East</b> | <b>North America</b> |
| +86 755 298 85888   | +353 61 225 977            | +1 408 785 5200      |

#### 4.6 CLOSED LOOP SYSTEM THROTTLING (CLST)

The power supply will always assert the SMBAlert# signal whenever temperature-monitored component in the power supply reaches a warning threshold. Upon reduction of the load within 2msec after the SMBAlert# signal is asserted if the load is reduced to less than the power supply rating; the power supply will continue to operate and not shutdown.

Figure 3. CLST Timing Requirements

#### 4.7 SMART RIDE-THROUGH (SmaRT)

The power supply will assert the SMBAlert# signal < 4 msec after AC input voltage is lost to 0 VAC.

### 5. CONTROL

#### 5.1 DEVICE ADDRESS LOCATION (B19: A0; B20: A1)

Address Bit 0: A 10k pull-up resistor pulled to internal +3.3 V in the PSU.  
Address Bit 1: A 10k pull-up resistor pulled to internal +3.3 V in the PSU.

| LOCATIONS                | PSU#1                                          | PSU#2 |
|--------------------------|------------------------------------------------|-------|

|                          | MIN                                            | MAX   |
| Logic level low voltage  | 0V                                             | 0.4V  |
| Logic level high voltage | 2.4V                                           | 3.46V |

#### 5.2 I2C BUS (S6: SCL; S5: SDA)

Each module shall provide SCL/SDA bus for EEPROM read/write of system. It's pull up from +3.3Vdd device by a 10K ohm resistor. System should be has 1k-2k ohm pull high resistor on the SCL/SDA bus. SCL/SDA pin should be link together and closer. The SCL/SDA bus total capacitance must lower 100pF from system and PDB. The max I2C bus speed is 100KHz and the mcu of PSU is slave device in I2C bus .The time interval of I2C command is 1ms.

### 5.3 SMBAlert# INDICATE (Pin A22: SMBAlert#)

This is an active low signal and indicates that the power supply is experiencing a problem that the user should investigate. This shall be asserted due to Critical events or Warning events. The signal shall activate in the case of critical component temperature reached a warning threshold, general failure, over-current, over-voltage, under-voltage, failed fan. This signal may also indicate the power supply is reaching its end of life or is operating in an environment exceeding the specified limits.

This signal is to be asserted in parallel with LED turning solid Amber or blink Amber.

| Sink current, Alert# = high          |                                                                                           | 50 uA  |

### 5.4 PS-ON INPUT SIGNAL (PIN: A21: PS-ON)

The PS-ON signal is required to remotely turn on/off the power supply. PSON# is an active low signal that turns on the +12V power rail. When this signal is not pulled low by the system, or left open, the outputs (except the +12VSB) turn off. This signal is pulled to a standby voltage by a pull-up resistor internal to the power supply.

| SIGNAL TYPE                         | ACCEPTS AN OPEN COLLECTOR/DRAIN INPUT FROM THE SYSTEM.<br>PULL-UP TO 3.3VSB LOCATED IN POWER SUPPLY. |          |
|-------------------------------------|------------------------------------------------------------------------------------------------------|----------|
| PSON# = Low                         | ON                                                                                                   |          |
| PSON# = High or Open                | OFF                                                                                                  |          |
|                                     | MIN                                                                                                  | MAX      |
| Logic level low (power supply ON)   | 0 V                                                                                                  | 1.0 V    |
| Logic level high (power supply OFF) | 2.0 V                                                                                                | 3.46 V   |
| Source current, Vpson = low         |                                                                                                      | 4 mA     |
| Power off delay: Tpson_off_delay    |                                                                                                      | 5 msec   |
| Power up delay: Tpson_on_delay      | 5 msec                                                                                               | 400 msec |
| PWOK delay: T pson_pwok             |                                                                                                      | 5 msec   |

### 5.5 PWOK OUTPUT SIGNAL (PIN A25: PWOK)

PWOK is a power OK signal and will be pulled HIGH by the power supply to indicate that all the outputs are within the regulation limits of the power supply. When any output voltage falls below regulation limits or when AC power has been removed for a time sufficiently long so that power supply operation is no longer guaranteed, PWOK will be de-asserted to a LOW state. See Table: for a representation of the timing characteristics of PWOK. The start of the PWOK delay time shall inhibited as long as any power supply output is in current limit.

| Signal Type                                                                                      |              |        |
|--------------------------------------------------------------------------------------------------|--------------|--------|
| Open collector/drain output from power supply.<br>Pull-up to 3.3VSB located in the power supply. |              |        |
| PWOK = High                                                                                      | Power OK     |        |
| PWOK = Low                                                                                       | Power Not OK |        |
|                                                                                                  | MIN          | MAX    |
| Logic level low voltage, Isink=400uA                                                             | 0V           | 0.4 V  |
| Logic level high voltage, Isource=200uA                                                          | 2.4V         | 3.46 V |

| Source current, PWOK = high                                                                      | 2 mA         |        |
| PWOK delay: Tpwok_on                                                                             | 100ms        | 500 ms |
| PWOK rise and fall time                                                                          | 100 usec     |        |

## 5.6 SMART ON CONTROL (PIN B22: ENABLE BY SYSTEM)

Before enabling Smart On function, make sure pin B22 (SMART ON) on output golden finger of each

PSU is connected together. When the pin is HIGH in the Smart On mode, the slave power supply will enter the Smart Standby mode if system total loading under PSU's pre-set load level. When the pin is LOW in the Smart On mode, the Smart Standby mode power supplies will work in normal redundancy mode.

Smart On feature supports 1+1, 2+1, and 3+1 redundant configurations. It uses the Power Management Bus manufacturer specific command area to define Power Management Bus commands for the system to communicate with the power supplies for enabling, configuration, and monitoring.

The Power Management Bus manufacturer specific command MFR\_SPECIFIC\_00 is used to configure the operating state of the power supply related to Smart On. We will call the command SMART\_ON\_CONFIG (D0h). Below is the definition of the values used with the Read-Write Byte SMBus protocol with PEC.

| Cold_Redundancy_Config (D0h) |                                              |                                                                                                                                            |
|------------------------------|----------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| Value                        | State                                        | Description                                                                                                                                |
| 00h                          | Standard Redundancy (default power on state) | Turns the power supply ON into standard redundant load sharing more. The power supply make sure no other PSU enter Smart_On mode.          |
| 01h                          | Cold Redundant Active <sup>1</sup>           | Defines this power supply to be the one that is always ON in a cold redundancy configuration.                                              |
| 02h                          | Cold Standby 1 <sup>1</sup>                  | Defines the power supply that is third to turn off in a Smart On configuration (800ms later) and first to turn on as the load increases.   |
| 03h                          | Cold Standby 2 <sup>1</sup>                  | Defines the power supply that is second to turn off in a Smart On configuration (600ms later) and second to turn on as the load increases. |
| 04h                          | Cold Standby 3 <sup>1</sup>                  | Defines the power supply that is first to turn off in a Smart On configuration (400ms later) and third to turn on as the load increases.   |

The trigger levels above may have a +/-10% tolerance for actual application. The default state of power supply is in Standard Redundancy mode. Power supply need to be re-specified a state whenever initial power on or the operating module predicts failure. The SMART\_ON\_CONFIG command will reset to 00h (Standard Redundancy) when any fault happened. And when an active power supply asserts, all parallel power supplies in Smart Standby mode shall power on immediately.

### 5.6.1 SMART STANDBY POWER SUPPLY OPERATING STATE

A power supply is put into Smart Standby whenever PSON# is asserted, SMART\_RED# is de-asserted, and SMART\_ON\_CONFIG value is set to 02h, 03h, or 04h. In the Smart Standby mode the power supply must.

1. Power ON when Smart\_On bus is driven LOW.
2. Keep PWOK asserted.
3. No Power Management Bus fault conditions reported via STATUS commands, any fault happen will made PSU leave smart standby mode.
4. Keep all fans rolling
5. LED is green blinking under normal conditions, amber blinking if any warning conditions happen.

**5.6.2 POWERING ON SMART STANDBY SUPPLIES TO MAINTAIN BEST EFFICIENCY**

Power supplies in Smart Standby state shall monitor the shared voltage level of the load share signal to sense when it needs to power on. Depending upon which position (1, 2, or 3) the system defines that power supply to be in the Smart Standby configuration; will slightly change the load share threshold that the power supply shall power on at.

**5.6.3 POWERING ON SMART STANDBY SUPPLIES DURING A FAULT OR OVER CURRENT CONDITION**

Some warnings happen or 12V output shutdown due to any fault will cause SRED\_OK# driven low. When an active power supply asserts its SRED\_OK# signal, all parallel power supplies in Smart Standby mode shall power on immediately.

The trigger condition:

1. 12V OC warning/ fault happens
2. 12V OVP fault
3. 12V Smart ON UVP (lower than 11.8V)
4. OTP fault
5. Fan speed fault
6. AC loss (Refer to section 3.1.3 table1, Power off voltage)
7. Send 00h to Power Management Bus D0h command
8. PSON# de-assertion happens

**5.6.4 THE WAY TO ENABLE SMART ON FUNCTION**

Here are the steps to put PSU into smart on mode. PSU which is assigned as smart on standby can operate in a power-off state and turn on main power if necessary.

Figure 4. Power On/Off of power supplies in Smart on Mode (4xxxxW PSUs)

### 5.7 PRESENT\_N# (Pin B24, OPTIONAL)

This signal is an active low type signal and is connected to the power supply's output ground internally. The mating pin of this signal in system side should have a pull-up resistor which limit the max. current 4mA to go through from this signal pin to the power supply. A Low state on this signal indicates the PSU is physically presents.

### 5.8 PS-KILL (Pin B25, OPTIONAL)

The purpose of the PS\_KILL pin is to enhance for hot swapping of the power supply. The PS\_KILL pin on the power supply is shorter than the other signal pins. When a power supply is operating in parallel with other power supplies and then extracted from the system, the PS\_KILL pin will quickly turn off the power supply main output +12V and prevent arcing of the DC output contacts. When the PS\_KILL signal pin is not pulled down or left opened (power supply is extracting from the system), the power supply shuts down regardless of the condition of the PSON# signal. The mating pin of this signal in the system should be tied to ground. Internal to the power supply, the PS\_KILL pin is connected to an internal +3.3V voltage through a 10kΩ pull-up resistor. Upon receiving a LOW state signal at the PS\_KILL pin, the power supply will be allowed to turn on via the PSON# signal. A LOW state on this pin by itself will not turn on the power supply +12V output. The below table shows the PS\_KILL signal characteristics.

| SIGNAL STATES                      | +12V |
|------------------------------------|------|
| PS_KILL = LOW, PSON = LOW          | ON   |
| PS_KILL = HIGH or OPEN, PSON = LOW | OFF  |
| PS_KILL = LOW, PSON = HIGH or OPEN | OFF  |

## 6. ELECTROMAGNETIC COMPATIBILITY

### 6.1 IMMUNITY

The power supply shall comply with EN55024.

| PARAMETER                      | DESCRIPTION / CONDITION                                        | CRITERION |

Figure 5. Mechanical Drawing

### 10.1 AIRFLOW DIRECTION

The normal airflow direction is from the card edge connector side to the AC inlet side of the power supply. The reverse airflow direction flows from the AC inlet side of the power supply to the card edge connector side (Fan out & forward Fan).

### 10.2 9.2 HANDLE RETENTION

The power supply has a handle to assist extraction. The module can be able to be inserted and extracted without the assistance of tools. The power supply has a latch which retains the power supply into the system and prevents the power supply from being inserted or extracted from the system when the AC power cord is pulled into the power supply. The handle protects the operator from any burn hazard through the use of the Customer Corporation Industrial designed plastic handle.

### 10.3 LED MARKING AND IDENTIFICATION

The power supply has a single bi-colored LED for indication of the power supply status. Green & Amber.

| POWER SUPPLY CONDITION                                                                                                  | LED STATE        |
|-------------------------------------------------------------------------------------------------------------------------|------------------|
| Output ON and OK                                                                                                        | GREEN            |
| No AC power to all power supplies                                                                                       | OFF              |
| AC present / Only 12VSB on (PS off) or PS in Smart on state                                                             | 1 Hz Blink GREEN |
| AC cord unplugged or AC power lost; with a second power supply in parallel still with AC input power.                   | AMBER            |
| Power supply warning events where the power supply continues to operate; high temp, high power, high current, slow fan. | 1 Hz Blink Amber |
| Power supply critical event causing a shutdown; failure, OCP, OVP, Fan Fail                                             | AMBER            |
| Power supply FW updating                                                                                                | 2 Hz Blink GREEN |

## 11. CONNECTORS

### 11.1 DC OUTPUT CONNECTOR PIN LOCATIONS

The power supply uses a card edge output connection for power and signal that is compatible with a 2x25 Power Card Edge connector (equivalent to 2x25 pin configuration of the FCI power card connector 10035388102LF).

| PIN-OUT | DEFINITION                        | PIN-OUT | DEFINITION          |
|---------|-----------------------------------|---------|---------------------|
| A1-9    | GND                               | B1-9    | GND                 |
| A10-18  | +12V                              | B10-18  | +12V                |
| A19     | Power Management Bus SDA          | B19     | A0 (SMBus Address)  |
| A20     | Power Management Bus SCL          | B20     | A1(SMBus Address)   |
| A21     | PSON                              | B21     | +12VSB              |
| A22     | SMBAlert#                         | B22     | SMART_ON            |
| A23     | Return Sense (Remote sense-)      | B23     | +12V Load Share Bus |
| A24     | +12V Remote Sense (Remote sense+) | B24     | PRESENT# (Reserved) |
| A25     | PWOK                              | B25     | NC                  |

Note: B25 is optional signal for PS\_KILL or Vin\_good;
