

# **TET2000 Series**

# **AC-DC / HVDC Front-End Power Supplies**

The TET2000 Series is a 2100 Watt AC-DC power-factor-corrected (PFC) and DC/DC power supply that converts standard AC mains power or high voltage DC bus voltages into a main output of 12 VDC for powering intermediate bus architectures (IBA) in high performance and reliability servers, routers, and network switches.

The TET2000-12-086 Series meets international safety standards and displays the CE-Mark for the European Low Voltage Directive (LVD).

### **Key Features & Benefits**

- Best-in-class, Meet Titanium efficiency
- Wide input voltage range: 180 264 VAC / 2100 W, 90 - 180 VAC / Linear derating
- AC input with power factor correction
- Always-on 24 W standby output (12 V / 2 A)
- Hot-plug capability
- Parallel operation with active current sharing thru analog bus
- Full digital controls for improved performance
- High density design: 51 W/in<sup>3</sup>
- Small form factor: 195 x 86 x 40 mm (7.68 x 3.39 x 1.57 in)
- Up to 400 kHz
- I2C communication interface with Power Management Bus protocol for monitoring, control, and firmware update via bootloader
- RoHS Compliant
- Status LED with fault signaling
- Safety-approved to IEC/EN 62368-1 and UL/CSA 62368-1.
- US patents

### **Applications**

- High Performance Servers
- Routers
- Switches

#### 1. ORDERING INFORMATION

#### 2. OVERVIEW

The TET2000-12-086 Series is a fully DSP controlled, highly efficient front-end power supply. It incorporates resonant-soft-switching technology and interleaved power trains to reduce component stresses, providing increased system reliability and very high efficiency. With a wide input operating voltage range and minimal linear derating of output power with respect to ambient temperature, the TET2000-12-86NA maximizes power availability in demanding server, switch, and router applications. The power supply is fan cooled and ideally suited for server integration with a matching airflow path.

The PFC stage is digitally controlled using a state-of-the-art digital signal processing algorithm to guarantee best efficiency and unity power factor over a wide operating range.

The DC-DC stage uses soft switching resonant techniques in conjunction with synchronous rectification. An active OR-ing device on the output ensures no reverse load current and renders the supply ideally suited for operation in redundant power systems. The always-on +12V standby output provides power to external power distribution and management controllers. Its protection with an active OR-ing device provides for maximum reliability.

Status information is provided with front-panel LED. In addition, the power supply can be monitored and controlled (i.e. fan speed setpoint) via I2C communication interface with Power Management Bus protocol. It allows full monitoring of the supply, including input and output voltage, current, power, and inside temperatures. The same I2C bus supports the bootloader to allow field update of the firmware in the DSP controllers.

Cooling is managed by a fan, controlled by the DSP controller. The fan speed is adjusted automatically depending on the actual power demand and supply temperature and can be overridden through the I2C buses.

#### 3. ABSOLUTE MAXIMUM RATINGS

Stresses in excess of the absolute maximum ratings may cause performance degradation, adversely affect long-term reliability and cause permanent damage to the supply.

<sup>2)</sup> The Front-End is provided with a typical hysteresis of 5 V during turn-on and turn-off within the ranges.

#### 4.1 INPUT FUSE

Quick-acting 16 A input fuses ( $5.4 \times 22.5$  in mm) in series with the L-line inside the power supply protect against severe defects. The fuses are not accessible from the outside and are therefore not serviceable parts.

### **4.2 INRUSH CURRENT**

The AC-DC power supply exhibits an X-capacitance of only 3.88 μF, resulting in a low and short peak current, when the supply is connected to the mains. The internal bulk capacitor will be charged through a PTC which will limit the inrush current.

**NOTE:** Do not repeat plug-in / out operations below 5sec interval time at maximum input, high temperature condition, or else the internal in-rush current limiting device PTC may not sufficiently cool down and self over temperature protection may result.

Figure 2. Inrush current, Vin = 264Vac, 90° CH3: Vin (500V/div), CH4: Iin (10A/div)

#### 4.3 INPUT UNDER-VOLTAGE

If the RMS value of input voltage (either AC or DC) stays below the input undervoltage lockout threshold  $V_{on}$ , the supply will be inhibited. Once the input voltage returns within the normal operating range, the supply will return to normal operation again.

### **4.4 POWER FACTOR CORRECTION**

Power factor correction (PFC) (see *Figure 3*) is achieved by controlling the input current waveform synchronously with the input voltage. A fully digital controller is implemented giving outstanding PFC results over a wide input voltage and load ranges. The input current will follow the shape of the input voltage. If for instance the input voltage has a trapezoidal waveform, then the current will also show a trapezoidal waveform. At DC input voltage the PFC is still in operation, but the input current will be DC in this case.

Figure 3. Power Factor vs. Load

#### 4.5 EFFICIENCY

The high efficiency (see *Figure 4*) is achieved by using state-of-the-art GaN power devices in conjunction with soft-transition topologies minimizing switching losses and a full digital control scheme. Synchronous rectifiers on the output reduce the losses in the high current output path. The rpm of the fan is digitally controlled to keep all components at an optimal operating temperature regardless of the ambient temperature and load conditions.

### **5.1 OUTPUT VOLTAGE RIPPLE**

Ripple and noise shall be measured using the following methods:

- a) Outputs bypassed at the point of measurement with a parallel combination of 10μF tantalum capacitor in parallel with 0.1μF ceramic capacitors, referring the setup in *Figure 19*.
- b) The ripple voltage is measured with 20 MHz BWL.

Figure 19. Output Ripple Test Setup

**Asia-Pacific** +86 755 298 85888 Europe, Middle East +353 61 49 8941

#### **5.2 SHORT TIME OVERLOAD**

The main output has the capability to allow load current up to 20% above the nominal output current rating for a maximum duration of 20ms. This allows the system to consume extended power for short time dynamic processes.

Figure 20. Short circuit on V1 (20ms/Div) CH2: V<sub>1</sub> (5V/div) CH4: Vin (100A/div)

#### 5.3 OUTPUT GROUND / CHASSIS CONNECTION

The output return path serves as power and signal ground. All output voltages and signals are referenced to these pins. To prevent a shift in signal and voltage levels due to ground wiring voltage drop a low impedance ground plane should be used as shown in *Figure 21*. Alternatively, separated ground signals can be used as shown in *Figure 22*. In this case the two ground planes should be connected at the power supplies ground pins.

**NOTE:** Within the power supply the output GND pins are connected to the Chassis, which in turn is connected to the Protective Earth terminal on the AC inlet. Therefore, it is not possible to set the potential of the output return (GND) to any other than Protective Earth potential.

Figure 21. Common Low Impedance Ground Plane

#### **6.1 OVERVOLTAGE PROTECTION**

The TET2000-12-086 Series front-end provides a fixed threshold overvoltage (OV) protection implemented with a HW comparator for both the main and the standby output. Once an OV condition has been triggered on the main output, the supply will shut down and latch the fault condition. The latch can be unlocked by disconnecting the supply from the AC mains or by toggling the PSON\_L input. The standby output will continuously try to restart with a 1 s interval after OV condition has occurred.

#### **6.2 UNDERVOLTAGE DETECTION**

Both main and standby outputs are monitored. PWOK pin signal if the output voltage exceeds  $\pm 5\%$  of its nominal voltage. The main output will latch off if the main output voltage when V1 falls below 11.2V (typically in an overload condition), the latch can be unlocked by disconnecting the supply from the AC mains or by toggling the PSON\_L input.

If the standby output leaves its regulation bandwidth for more than 10ms then the main output is disabled to protect the system, and the standby output will continuously try to restart with a 1s interval after UV condition has occurred.

#### **6.3 CURRENT LIMITATION**

#### **MAIN OUTPUT**

The main output current limitation level  $I_{V1 \text{ lim}}$  will decrease if the ambient (inlet) temperature increases beyond 50 °C (see *Figure24* and *Table1*). Note that the current limitation on  $V_1$  will kick in at a current level approximately 10A-16A higher nominal output current that is shown.

The  $2^{nd}$  protection is a substantially rectangular output characteristic controlled by a software feedback loop. This protects the power supply and system during the 20ms blanking time of the static over current protection. If the output current is rising fast and reaches  $l_{V1 \text{ ol lim}}$ , the supply will immediately reduce its output voltage to prevent the output current from exceeding  $l_{V1 \text{ ol lim}}$ . When the output current is reduced below  $l_{V1 \text{ ol lim}}$ , the output voltage will return to its nominal value.

When the main output over current, the V<sub>1</sub> will shut down and latch off. The latch can be cleared by recycling the input voltage or the PSON\_L input. A failure on the Main output will shut down only the Main output, while Standby continues to operate.

<sup>4)</sup> Limit set doesn't include effects of main output capacitive discharge.

Table1. Main Output Nominal Output Current I<sub>1 nomil</sub> & Current Limitation I<sub>V1 lim</sub> vs Inlet Temperature (degC) & Vin(Vac)

### STANDBY OUTPUT

On the standby output a hiccup type over current protection is implemented. This protection will shut down the standby output immediately when standby current reaches or exceeds  $k_{SB \text{ lim}}$ . After an off-time of 1s the output automatically tries to restart. If the overload condition is removed the output voltage will reach again its nominal value. At continuous overload condition the output will repeatedly trying to restart with 1s intervals. A failure on the Standby output will shut down both Main and Standby outputs.

R <sub>puPSON_L</sub>	Internal pull up resistor to internal 3.3 V on PSON_L			10		kΩ

Table 3. Input signals

### 8.1.1 PSKILL INPUT

The PSKILL input is an active-high and normally a trailing pin in the connector and is used to disconnect the main output as soon as the power supply is being plugged out. This pin should be connected to SGND on the system. The standby output will remain on regardless of the PSKILL input state.

**Asia-Pacific** +86 755 298 85888 **Europe, Middle East** +353 61 49 8941

#### 8.1.2 PSON\_L INPUT

The PSON\_L is an internally pulled- up (3.3 V) input signal to enable / disable the main output V1 of the front-end. This active-low pin is also used to clear any latched fault condition. Figure 26 shows PSON\_L circuit used in PSU and proposed connections.

Figure 26. PSON\_L Connection

#### **8.1.3 SENSE INPUTS**

The main output has sense lines implemented to compensate for voltage drop on load wires in both positive and negative path. The maximum allowed voltage drop is 200 mV on the positive rail and 50 mV on the GND rail.

With open sense inputs the main output voltage will rise by 250 mV. Therefore, if not used, these inputs should be connected to the power output and GND at the power supply connector. The sense inputs are protected against short circuit. In this case the power supply will shut down.

Table 4. Output signals

#### 8.2.1 **PWOK**

PWOK is a power OK signal and will be pulled HIGH by the power supply to indicate that all the outputs are within the regulation limits of the power supply. When any output voltage falls below regulation limits or when AC power has been removed for a time sufficiently long so that power supply operation is no longer guaranteed, PWOK will be de-asserted to a LOW state.

Figure 27. PWOK circuit in PSU

### 8.2.2 ACOK

The ACOK is an open collector output that requires an external pull-up to a maximum of 12V indicating whether the input is within the range the power supply can use and turn on. A 15V zener diode is added on this signal pin versus signal ground SGND to protect internal circuits from negative and high positive voltage. The ACOK signal is active-high.

Figure 28. ACOK Connection

**Asia-Pacific** +86 755 298 85888 Europe, Middle East +353 61 49 8941

#### 8.2.3 SMB\_ALERT\_L

The SMB\_ALERT\_L signal indicates that the power supply is experiencing a problem that the system agent should investigate. This is a logical OR of the Shutdown and Warning events. It is asserted (pulled Low) at Shutdown or Warning events such as reaching temperature warning/shutdown threshold of critical component, general failure, over-current, over-voltage, under-voltage or low-speed of failed fan. This signal may also indicate the power supply is operating in an environment exceeding the specified limits. This signal is to be asserted in parallel with LED turning solid Amber.

The power supply shall assert the over temperature SMB\_ALERT\_L signal when a hot spot or inlet temperature sensor crosses a warning threshold. The inlet temperature warning threshold must be set at 62.5°C, preventing exhaust air and cord temperatures temperature exceeding safety ratings. The warning gets deserted once inlet air temperature returns into specified operating temperature range. Fan speed control algorithm shall ramp up the fan speed to the maximum prior to the SMB\_ALERT\_L insertion. A 15V zener diode is added on this signal pin versus signal ground SGND to protect internal circuits from negative and high positive voltage.

Figure 29. SMB\_ALERT\_L Connection

#### **8.2.4 PRESENT L OUTPUT**

The PRESENT\_L pin is wired to internal SGND within the power supply. This pin does indicate that there is a power supply present in this system slot. An external pull-up resistor has to be added within the application. Current into PRESENT\_L should not exceed 4 mA to guarantee a low level voltage if power supply is seated.

Figure 30. PRESENT\_L Signal Pin

#### 8.3 ELECTRICAL CHARACTERISTICS (BIDIRECTIONAL SIGNALS)

#### **8.3.1 CURRENT SHARE**

All Output signals versus signal ground SGND in PSU

The TET front-ends have an active current share scheme implemented for V1. All the ISHARE current share pins need to be interconnected in order to activate the sharing function. If a supply has an internal fault or is not turned on, it will disconnect its ISHARE pin from the share bus. This will prevent dragging the output down (or up) in such cases.

The current share function uses an analog bus to transmit and receive current share information. The controller implements a Master/Slave current share function. The power supply providing the largest current among the group is automatically the Master. The other supplies will operate as Slaves and increase their output current to a value close to the Master by slightly increasing their output voltage. The voltage increase is limited to +250 mV. The output will share within 5% at full load.

ISHARE pins must be interconnected without any additional components. This in-/output has a 15 V zener diode as a protection device and is disconnected from internal circuits when the power supply is switched off.

The 12 VSB output is not required to actively share current between power supplies (passive sharing).

No of paralleled PSUs	Maximum available power on main 12V without redundancy	Maximum available power on main 12V with n+1 redundancy	Maximum available power on standby output
1	2000 W	-	24 W
2	3900 W	2000 W	24 W
3	5800 W	3900 W	24 W
4	7700 W	5800 W	24 W
5	9600 W	7700 W	24 W
6	11500 W	9600 W	24 W

Table 5. Power Available When PSU in Redundant Operation

#### **8.4 FRONT LEDS**

The front-end has 1 front LED showing the status of the supply. LED is bi-colored: green and yellow, and indicates DC power presence or fault situations. For the position of the LED see *Table* lists the different LED status.

OPERATING CONDITION	LED State
Output ON and OK	Solid GREEN
No AC power to all power supplies	OFF
AC cord unplugged or AC power lost; with a second power supply in parallel still with AC input power.	OFF
AC present / Only 12VSB on (Standby mode)	1Hz Blink GREEN
Power supply warning events where the power supply continues to operate; high temp, high current, slow fan.	1Hz Blink AMBER
Power supply critical event causing a shutdown; eg. OCP, OVP, OTP, Fan Fail	Solid AMBER
Power supply in FW upload mode	2Hz Blink GREEN

Table 6. LED Status

### 8.6 I2C / Power Management Bus COMMUNICATION

Figure 35. Physical Layer of Communication Interface

The TET front-end is a communication Slave device only; it never initiates messages on the I2C/SMBus by itself. The communication bus voltage and timing is defined in  $Table\ 8$  further characterized through:

- The SDA/SCL IOs use 3V3 logic levels
- External pull-up resistors on SDA/SCL required for correct signal edges
- Full SMBus clock speed of 400 kbps
- Clock stretching limited to 1 ms
- SCL low time-out of > 25 ms with recovery
- within 10 ms
- Recognizes any time Start/Stop bus conditions

Communication to the DSP or the EEPROM will be possible as long as the input AC voltage is provided. If no AC is present, communication to the unit is possible if it is connected to a life 12 V or 12 VSB output (provided e.g. by the redundant unit).

PARAME	TER DESCRIPTION	CONDITION	MIN	MAX	UNIT

Table 8. I2C / SMBus Specification

Figure 36. I2C / SMBus Timing

#### **ADDRESS SELECTION**

The address for I2C communication can be configured by pulling address input pins A0, A1 and A2 either to GND (Logic Low) or leave them open (Logic High). An internal pull up resistor (10kohm) will cause the A0, A1 and A2 pin to be in High Level if left open. A fixed addressing offset exists between the Controller and the EEPROM.

#### **I2C ADDRESS**

			I2C A	ddress
A2	<b>A</b> 1	<b>A</b> 0	Power Management Bus Address	EEPROM Address
0	0	0	0xB0	0xA0
0	0	1	0xB2	0xA2
0	1	0	0xB4	0xA4
0	1	1	0xB6	0xA6
1	0	0	0xB8	0xA8
1	0	1	0xBA	0xAA
1	1	0	0xBC	0xAC
1	1	1	0xBE	0xAE

Table 9. Address and Protocol Encoding

**Asia-Pacific** +86 755 298 85888 **Europe, Middle East** +353 61 49 8941

#### 8.7 CONTROLLER AND EEPROM ACCESS

The controller and the EEPROM in the power supply share the same I2C bus physical layer (see *Figure* 37) and can be accessed under different addresses, see *Table 9 Address and Protocol Encoding*.

The SDA/SCL lines are connected directly to the controller and EEPROM which are supplied by internal 3V3.

The EEPROM provides 256 bytes of user memory. None of the bytes are used for the operation of the power supply.

Figure 37. I2C Bus to DSP and EEPROM

#### 8.8 EEPROM PROTOCOL

The EEPROM follows the industry communication protocols used for this type of device. Even though page write / read commands are defined, it is recommended to use the single byte write / read commands.

#### **WRITE**

The write command follows the SMBus 1.1 Write Byte protocol. After the device address with the write bit cleared a first byte with the data address to write to is sent followed by the data byte and the STOP condition. A new START condition on the bus should only occur after 1ms of the last STOP condition to allow the EEPROM to write the data into its memory.

#### **READ**

The read command follows the SMBus 1.1 Read Byte protocol. After the device address with the write bit cleared the data address byte is sent followed by a repeated start, the device address and the read bit set. The EEPROM will respond with the data byte at the specified location.

#### **8.9 POWER MANAGEMENT BUS PROTOCOL**

The Power Management Bus is an open standard protocol that defines means of communicating with power conversion and other devices. For more information, please see the System Management Interface Forum web site at: <a href="www.powerSIG.org">www.powerSIG.org</a>. Power Management Bus command codes are not register addresses. They describe a specific command to be executed. TET2000-12-086 Series supply supports the following basic command structures:

- Clock stretching limited to 1 ms
- SCL low time-out of >25 ms with recovery within 10 ms
- Recognized any time Start/Stop bus conditions

#### WRITE

The write protocol is the SMBus 1.1 Write Byte/Word protocol. Note that the write protocol may end after the command byte or after the first data byte (Byte command) or then after sending 2 data bytes (Word command).

In addition, Block write commands are supported with a total maximum length of 255 bytes. See TET2000-12-086 Series Programming Manual for further information.

#### **READ**

The read protocol is the SMBus 1.1 Read Byte/Word protocol. Note that the read protocol may request a single byte or word.

In addition, Block read commands are supported with a total maximum length of 255 bytes. See TET2000-12-086 Series Power Management Bus Communication Manual URP.00560 for further information.

**NOTE:** A 3D step file of the power supply casing is available on request.

### 10. TEMPERATURE AND FAN CONTROL

#### **10.1 FAN CONTROL**

To achieve best cooling results sufficient airflow through the supply must be ensured. Do not block or obstruct the air-flow at the rear of the supply by placing large objects directly at the output connector. The TET2000-12-086NA is provided with a rear to front airflow, which means the air enters through the DC-output of the supply and leaves at the AC-inlet and TET2000-12-086RA is reversed. The fan inside of the supply is controlled by a microprocessor. The rpm of the fan is adjusted to ensure optimal supply cooling and is a function of output power and the inlet temperature.

Figure 40. Airflow Direction

Figure 41. Fan Speed vs. Main Output Load

### 10.2 TEMPERATURE MONITOR AND OVER TEMPERATURE PROTECTION

The TET2000-12-086 Series provides access via I2C to the measured temperatures of in total 4 sensors within the power supply, see *Table* 10. The microprocessor is monitoring these temperatures and if warning threshold of one of these sensors is reached it will set fan to maximum speed. If temperatures continue to rise above shut down threshold the main output V1 (or VSB if auxiliary converter is affected) will be disabled. At the same time the warning or fault condition is signalized accordingly through LED, PWOK and SMB\_ALERT\_L.

TEMPERATURE SENSOR	DESCRIPTION / CONDITION	POWER MANAGEMENT BUS REGISTER	WARNING THRESHOLD	SHUT DOWN THRESHOLD
Inlet air temperature	Sensor located on control board close to DC end of power supply	0x8D	NA:62.5C RA:62.5C	NA:65C RA:65C
Oring Mosfet	Sensor located close to Oring Mosfet	0x8E	NA:90C RA:105C	NA:95C RA:110C
Outlet air temperature	Sensor located on main board close to AC front of power supply	0x8F	NA:80C RA:85C	NA:85C RA:90C
PFC&DC-DC heat sink	Sensor located on PFC heat sink and DC-DC heatsink			NA&RA:130C

Table 12. Emission

### 12. SAFETY / APPROVALS

Maximum electric strength testing is performed in the factory according to IEC/EN 62638-1, and UL/CSA 62368-1. Input-to-output electric strength tests should not be repeated in the field. Bel Power Solutions will not honor any warranty claims resulting from electric strength field tests.

PARAMETER	R DESCRIPTION / CONDITION MIN NOM MAX				UNIT
Agency Approvals	IEC 62368-1				
Isolation Strength	Input (L/N) to case (PE)	Basic			
isolation Strength	Input (L/N) to output		Reinforced		
Creepage / Clearance	Primary (L/N) to protective earth (PE)	3.0			mm
Creepage / Clearance	Primary to secondary	6.0			mm
Floatrical Strongth Toot	Input to case	2.5			kVDC
Electrical Strength Test	Input to output	4.0			KVDC

Table 13. Safety/Approvals

### 13. ENVIRONMENTAL

Power supply shall meet the thermal requirements under the load and environmental condition identified in each table. Even though the table addresses only the exhaust air temperature, all other components in the power supply shall also meet their temperature specifications and lifetime requirements.

The power supply must meet UL enclosure requirements for temperature rise limits. All sides of the power supply with exception to the air exhaust side must be classified as "Handle, knobs, grips, etc. held for short periods of time only".

In case the exit air temperature requirement cannot be met, the power supply must have a warning label for high touch temperature in compliance with IEC/UL 60950-1 and additionally 85C rated power cords must also be used with this power supply.

PARA	METER	DESCRIPTION / CONDITION	MIN NOM	MAX	UNIT
T. Analoiant Tanan anatuma		$V_{1min}$ to $V_{1max}$ , $I_{1nom}$ , $I_{8Bnom}$ at $5000m$	0	+40	°C
/A	T <sub>A</sub> Ambient Temperature	$V_{imin}$ to $V_{imax}$ , $h_{inom}$ , $k_{Bnom}$ at 2000 m	0	+50	°C
T <sub>Aext</sub>	Extended Temp. Range	Derated output at 2000 m	+50	+60	°C
$T_{\mathcal{S}}$	Storage Temperature	Non-operational	-40	+70	°C
	Altitude	Operational, above Sea Level (see derating)	-	5000	m

Table 14. Operation Environmental

### 14. CONNECTIONS

The AC input receptacle shall be a 3 pins IEC320 C20 inlet. For the pin assignment of DC connector, please refer to *Figure 43* and *Table 15*. The Mating connector should be FCI 10121510-480020ALF

Figure 43. Pin Assignment of DC Connector

PIN	NAME	DESCRIPTION
P13-24, P25-36	V1	+12 VDC main output
P1-12, P37-48	PGND	+12 VDC main output ground
S1	PSKILL	Power supply kill (trailing pin) 5): active-high
S2	ACOK	AC input OK signal: active-high
S3	SDA	I <sup>2</sup> C DATA I <sup>2</sup> C data signal line
S4	SCL	I <sup>2</sup> C CLOCK I <sup>2</sup> C clock signal line
S5	ISHARE	12 V Load Share V <sub>1</sub> Current share bus
S6	A0	I <sup>2</sup> C Address I <sup>2</sup> C address selection input
S7	A1	I <sup>2</sup> C Address I <sup>2</sup> C address selection input
S8	PWOK	Power OK signal output: active-high
S9	A2	I <sup>2</sup> C address selection input
S10	EEPROM_WP	EEPROM write protect
S11	SGND	Signal ground <sup>6)</sup> (return)
S12	PSON_L	Power supply on input: active-low
S13	SMB_ALERT_L	SMB Alert signal output: active-low
S14	PRESENT_L	Power supply present (trailing pin): active-low
S15-16	VSB_GND	Standby Ground <sup>5)</sup>
S17-18	VSB	Standby positive output
S19	V1_SENSE-	Main output negative sense
S20	V1_SENSE+	Main output positive sense

 $<sup>^{\</sup>rm 5)}$  This pin should be connected to SGND on the system

Table 15. Connector pin assignment
